

WEBSITE REVIEW

Regen Biocorps

Website Problems Audit

A focused assessment of the current public website, covering user experience, product discovery, content quality, conversion, technical maintenance and accessibility.

Website reviewed https://regenbiocorp.com/	Review date 31 August 2026
--	--------------------------------------

Scope note: Findings reflect the publicly visible website at the time of review. Server configuration, private dashboards and unpublished content were not inspected.

Executive summary

The website contains substantial company information and a broad set of product-detail links, but its main customer journey is weakened by a blank Products page, dense homepage copy, unclear conversion paths and several visible maintenance issues. The most urgent work is to restore product discovery, clarify the company's value proposition and establish a safe WordPress staging workflow.

Priority	Finding	Required outcome
1	Products page is visibly empty	Build a searchable product catalogue
2	Homepage message is broad and text-heavy	Create a concise, audience-led homepage
3	Impact counters display zero	Show validated numbers with a non-animation fallback
4	Calls to action are weak or inconsistent	Direct visitors to products and technical enquiries
5	WordPress/plugin maintenance signals are visible	Back up, stage, update and simplify the stack

Platform and editability

The public site exposes WordPress and Elementor assets. Most copy, image, layout, navigation and page-template changes can therefore be completed without possessing a local source-code repository, provided the company supplies WordPress Administrator access. Hosting and SFTP access are still required for safe backups, staging, troubleshooting and custom development.

- Do not edit the live site first. Build and approve changes on a staging copy.
- Request WordPress Administrator, hosting, SFTP, analytics and Search Console access.
- Use custom code only for advanced filtering, integrations, special interactions or theme-level repairs.

Problems found - critical customer journey

01 Products page has no visible product content

CRITICAL

Observed: The public /products/ page renders the global header and footer but no visible catalogue or product list.

Business impact: A high-intent visitor cannot browse the company's offering from the primary Products navigation item, creating an immediate loss of trust and enquiries.

Recommended fix: Build a Poultry/Aqua product catalogue with health-concern filters, product cards, detail links and enquiry actions. Add a clear empty-state only when filters return no results.

02 Homepage hero does not communicate a distinctive value proposition

HIGH

Observed: The first screen presents a broad Poultry message and an About Us button rather than a clear product or enquiry path.

Business impact: Visitors must interpret the business before understanding what to explore next, weakening first-impression clarity and conversion.

Recommended fix: Lead with a concise science-and-nature proposition. Add separate actions for Poultry Solutions, Aqua Solutions and the Technical Team.

03 Homepage copy is too dense

HIGH

Observed: Long sections for company history, inspiration, vision, focus, commitment, public health, mission and values appear on the homepage.

Business impact: Important information competes for attention, making the page difficult to scan and pushing products and proof points too far down.

Recommended fix: Keep short summaries on the homepage and move detailed history, mission and values to the About page. Use headings, cards and three-to-five-point summaries.

04 Impact counters display zero

HIGH

Observed: The public homepage exposes 0 Successful Years, 0 Happy Customers and 0 States Covered.

Business impact: Zero values undermine credibility and make an intended trust signal look broken or unverified.

Recommended fix: Insert company-approved figures and render the final values in HTML so they remain visible if the number animation fails.

05 Product discovery lacks clear structure

HIGH

Observed: Individual product links exist, but the primary catalogue experience does not organize them around species, health challenge or solution type.

Business impact: Farmers, veterinarians and distributors cannot efficiently find the right solution for their needs.

Recommended fix: Create a consistent taxonomy: Poultry/Aqua, health concern, product form and application. Apply this structure to navigation, filters, cards and related products.

Problems found - content, trust and maintenance

06 Product pages need a repeatable information template

HIGH

Observed: The current navigation exposes many individual product URLs without a clearly standardized catalogue context.

Business impact: Inconsistent product presentation makes comparison difficult and increases content-maintenance effort.

Recommended fix: Use one reusable template containing target species, challenge, benefits, active ingredients, mechanism, usage, pack sizes, evidence, brochure and enquiry action.

07 Calls to action are inconsistent

MEDIUM

Observed: The main hero points to About Us while other key conversion options are scattered across WhatsApp, contact and product links.

Business impact: Visitors lack a predictable next step and may leave without starting a technical or commercial enquiry.

Recommended fix: Standardize primary actions as Explore Solutions, View Product and Send Enquiry. Keep one persistent Technical Support or WhatsApp action.

08 Copy quality and terminology need editorial review

MEDIUM

Observed: Several public passages contain long sentences, inconsistent capitalization and grammatical issues.

Business impact: Editorial inconsistency weakens the scientific and professional positioning of the company.

Recommended fix: Create an approved terminology guide and professionally edit every page. Require technical/regulatory approval for efficacy and animal-health claims.

09 Footer information appears dated

MEDIUM

Observed: The public footer displays a 2021 copyright notice.

Business impact: An old date makes the website appear unattended even when news content is recent.

Recommended fix: Use a dynamically generated current year and add Privacy Policy, Terms, email and certification links.

Problems found - technical quality

10 Visible front-end console error

MEDIUM

Observed: The site reports that Popup Maker was not found after waiting on the homepage and Products page.

Business impact: Unresolved script dependencies can create broken interactions, unnecessary load and harder maintenance.

Recommended fix: Audit the Popup Maker integration on staging. Repair the dependency or remove the unused loader and associated assets.

11 Plugin and analytics stack needs consolidation

MEDIUM

Observed: The public page loads many WordPress plugins and exposes both Google Tag Manager and direct Google Analytics resources.

Business impact: Excess assets can reduce performance and duplicate analytics events if configuration overlaps.

Recommended fix: Inventory every plugin and tracking tag. Remove unused plugins, centralize analytics through one approved implementation and validate events in staging.

12 Accessibility and semantic hierarchy need testing

MEDIUM

Observed: The homepage uses multiple large section headings and icon-font elements; product links are not always accompanied by descriptive visible labels in the catalogue area.

Business impact: Assistive-technology users may receive a confusing page outline or unclear controls, and search engines receive weaker content structure.

Recommended fix: Use one descriptive H1 per page, logical H2/H3 structure, descriptive link labels, keyboard-visible focus, meaningful image alt text and verified colour contrast.

Prioritized remediation plan

Phase 1 - protect and diagnose

- Create a complete file and database backup.
- Create a password-protected staging copy.
- Inventory WordPress, theme, Elementor templates, plugins, forms and analytics tags.
- Confirm the approved product list, content owners and regulatory review process.

Phase 2 - repair the conversion path

- Restore the Products page and build Poultry/Aqua filtering.
- Create a reusable product-detail template.
- Replace the hero with a clear value proposition and solution-led actions.
- Fix impact counters and test all forms, phone and WhatsApp links.

Phase 3 - redesign and rewrite

- Shorten the homepage and move detailed corporate content to About.
- Establish global colours, typography, buttons, cards, spacing and responsive rules in Elementor.
- Professionally edit company and product copy with technical approval.
- Modernize header, footer, trust signals, certifications and enquiry modules.

Phase 4 - quality and launch

- Update WordPress, theme and plugins on staging after backup.
- Remove unused plugins, compress images and configure caching.
- Test mobile layouts, accessibility, SEO metadata, redirects and analytics.
- Obtain stakeholder approval, deploy, clear caches and monitor for one week.

Recommended decision: improve the existing WordPress/Elementor site through a staging environment. A full custom-code rebuild is only necessary if advanced catalogue logic, integrations or major platform changes are required.
